

China May Have A “Space Submarine” Circling The Earth.

By Conrad Leister

The biggest fear, of military commanders, in the current world is that North Korea may have a covert submarine parked off the shore of California. It would be almost impossible to stop an attack launched by such a stealth missile launcher.

A new fear has emerged and it is not from the depths of the ocean but the depths of space. Could China or Russia have space vehicle filled with kinetic weapons hovering above the United States?

The U.S. Military is widely documented as having it's own X-Series Space Plane on months-long secret missions around our planet. Foreign newspapers have theorized that the U.S. Space plane is also filled with kinetic weapons.

A kinetic weapon is like a tactical meteorite. It is a metal rock that can be aimed and that does not burn up like a regular meteorite. There are two kinds: Molten and Force Based. A Molten tactical weapon uses the atmospheric burn up to turn a warhead into a molten glob of plasma that hurtles out of the sky at amazing speeds. It can burn through almost any structure.

A Force Based kinetic space weapon uses the type of ceramic shielding that protects space craft during atmospheric re-entry. Force based weapons do not burn up but gather force and energy from falling back to Earth. They are guided meteors that do not rely on heat build-up but, instead, pack the punch of the biggest fist in the galaxy. A small cloud of kinetic weapons could destroy Manhattan without leaving any radiation.

The X-Series U.S. Space Plane, filled with 300 kinetic weapon-heads, could destroy much of Beijing and many other Chinese cities. While North Korea may not have the capability to build such a space drone, China does have that capability and may have already done it.
